Enzyme; antifungal; fungal disease; acetohydroxyacid isomeroreductase. Morin V; Effantin G, ABR64305 standard; protein; 400 AA. Acetohydroxyacid isomeroreductase. Zundel JL, (AVET) AVENTIS CROPSCIENCE SA. 10-SEP-2001; 2001FR-00011689. 10-SEP-2001; 2001FR-00011689. 16-SEP-2003 (first entry) Lebrun MH, Neurospora crassa. FR2829363-A1. 14-MAR-2003. ABR64305; Dumas R) ABR64305

Treatment of crops, useful for controlling fungi on, e.g. cereals, potato, cotton or rape, comprises applying inhibitor of acetohydroxy acid isomeroreductase. WPI; 2003-405775/39.

Claim 2; Fig 1; 66pp; French.

The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention

(I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used

The invention describes a method of identifying a test compound as a candidate for an antibiotic comprising contacting ornithine candidate for an antibiotic comprising contacting ornithine carbamoytransferase (Ocrase) or ketol-acid reductoisomerase polypeptide, or fungal pathogenicity-conferring gene with a test compound. The method comprises: contacting Ocrase polypeptide, ketol-acid reductoisomerase polypeptide or fungal pathogenicity-conferring gene with a test compound; and detecting the presence or absence of binding between the test compound and the polypeptide or gene, where binding indicates that the test compound and the polypeptide or gene, where binding indicates that the test compound at least 50% sequence denciding a solated nucleic acid comprising a nucleotide sequence encoding a losypeptide having at least 50% sequence identity to, or having at least 10% of the activity of, 400, 403 or 469 amino acids; and an isolated polypeptide consisting essentially of the amino acid sequence of 400, or 469 amino acids actide acids. The methods are useful for identifying inhibitors of or 469 amino acids. The action acids conferring gene as antibiotics. This is the amino acid curgal pathogenicity-conferring gene as antibiotics. This is the amino acid sequence of Magnaporthe grisea ketol-acid reductoisomerase ILV5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              299 EATQSLYPLIGANGMDWYYEACSTTARRGAIDWSPRFKDALKPVFNQLYDSVKDGSETQR 358
                                                                                                                                                                                                                            The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (1) of acetohydroxyacid isomeroreductase. (1) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention

The invention describes a method of identifying a test compound as a candidate for an antibiotic comprising contacting ornithine carbamoytransferase (Ocrase) or ketol-acid reductoisomerase polypeptide, or fungal pathogenicity-conferring gene with a test compound. The method comprises: contacting Ocrase polypeptide, ketol-acid reductoisomerase polypeptide, or fungal pathogenicity-conferring gene with a test compound of expecting the presence or absence of binding between the test compound and the polypeptide or gene, where binding indicates that the compound and the polypeptide or gene, where binding indicates that the set compound at least 50% sequence identity to, or having at least 10% of the activity of, 400, 403 or 469 amino acids; and an isolated polypeptide consisting essentially of the amino acids and insolated polypeptide consisting essentially of the amino acids and insolated or 469 amino acids and fungal or 469 amino acids and fungal pathogenicity-conferring gene as antibiotics. This is the amino acid sequence of worder pathogenicity-conferring gene as antibiotics. This is the amino acid sequence of Mycosphaerella graminical ketol-acid reductoisomerase KARI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic corganism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contemination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. iumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologues sesential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antibodies to a sign and antibodies, and for identifying polymucleotides encoding the other protein vith which binding occurs or to identify inhibitors of the binding of interaction. The polypeptides may be used to raise antibodies or to elict annibution of interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                              essential gene; Aspergillus fumigatus; infection; biofilm; antibody; immune response.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ETVEEATQSLYPLIGAHGMDWMFDACSTTARRGAIDWTPKFKDALKPVFNNLYDSVKNGD 356
               the invention are used to treat or pevent infections by pathogenic organism such as A. fundatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fundatus, or to prevent or inhibit formation on a surface of a captesing comprising A. fundatus. The polymuclectides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fundatus to identify duplicated genes or paralogues having the same or similar blochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologue sesential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Fungicide; cytostatic; essential gene; Aspergillus fumigatus; infection;
cancer; contamination; biofilm; antibody; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                GKSWEDAIQDGWVPGKNLFDVDEAISRGTIVMNLLSDAAQSETWPHIKPQITKGKTLYFS

Lemieux SM Hu W, Eroshkin AM, Zamudio C, Jiang B, Tishkoff D, WPI; 2003-093124/08 , purified or isolated nucleic acids of essential genes of Aspergillus nigatus, useful for treating or preventing infections by A. fumigatus, for treating a non-infectious disease in a subject e.g. cancer.

Disclosure; Page; 175pp; English

The invention relates to novel puritise or isolated nucleic acids of essential genes of Aspergillus funiqatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic corganism such as A. funigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contamination of an object by A. fumigatus, or to prevent or contamination of an object by A. fumigatus, or to prevent or contamination of an object corpusion of an object corpusion of an object corpusion of the funigatus. The polymorlectides are useful for expressing recombinant protein for characterisation, screening or characterisation, screening or characterisation, screening or corganisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential or virulence genes, for selecting and conting on to raise anti-DNA antibodies or to elicit another immune response, and for identifying polymucleotides encoding the other protein crapsonse, and for identifying polymucleotides encoding the other protein crapsonse, and for identifying polymucleotides encoding the other protein crapsonse, and for identifying polymucleotides encoding the other protein crapsonse, and for identifying polymucleotides encoding the other for elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to issolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes or of Aspergillus fundagatus of the invention invention relates to novel purified or isolated nucleic acids of

Eroshkin AM,

Disclosure; Page; 175pp; English.

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofilm comprising A. fumigatus. The polymocleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an an entire or attachment to another immune response, and for identifying polynucleotides encoding the other protein

5
with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to fasolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention

strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified essential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to as GRACE strains of the organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus fumigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAU15053-AAU15113 represent proteins encoded by C. albicans
                                                                                                                                                                                                                                                                                                                                                                            ហ

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertions or promoter replacement fragment with a heterologous recombination, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that expression both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon capound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division compound catabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division compound so thinbibit growth or proliferation of C. albicans cells and cessential C. albicans related a brinted abbicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                 Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 44; SEQ ID NO 7075; 167pp + Sequence Listing; English

                                                                                                                                                                                                                                                                                                                                                                                       Treatment of crops, useful for controlling fungi on, e.g. cereals, potato, cotton or rape, comprises applying inhibitor of acetohydroxy acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          240

The invention relates to novel protein complexes comprising a first and a second protein, or its derivative, fragment, homologue or variant. The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency conditions. The protein complexes are particularly agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful con screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein consponents of the complex is useful for the manufacture of a medicament or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was

A polymucleotide of the invention has fungicide activity, and may have a use in gene therapy. The nucleic acid is useful for preparing a use in gene treating an infection caused by Cryptococcus neoformans. The present sequence represents a C. neoformans sequence of the invention. Note: The sequence data for this patent is not represented in

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide (5) producing the polypeptide of specifically binding the polypeptide (5) producing the polypeptide; (6) inhibiting cellular croproliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for croproliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological corpusion a gene required for cellular proliferation of identifying a gene required for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the sene corpusion of strains; or (13) identifying the target of a compound that inhibits the extent compound that inhibits proliferation of a strains; or (13) identifying proteins or screening for homologous nucleic acids are useful for dence of for cellular proliferation of an organism. The antisense nucleic acids are useful for for confound in a conformance or for severations or for confound confound that inhibits are confound and confound actional actions or for confound and confound action of an organism. The antisense nucleic acids are useful for for cellular proliferation to solate candidate molecules for rational and antisement and acids are useful for an action of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed property from part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              57 MDFAGHKEEVHERADWPAEKLLDYFKNDTLALIGYGSQGHGQGLNLRDNGLNVIVGVRKN 116

Morin V;

Treatment of crops, useful for controlling fungi on, e.g. cereals, potato, cotton or rape, comprises applying inhibitor of acetohydroxy acid isomeroreductase.

Claim 2; Fig 1; 66pp; French.

The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention

The proteins are selected from given protein complexes, which are not defined in the specification. The variants are encoded by nucleic acids that hybridize to the nucleic acids encoding the proteins under low stringency
                                                                                                                                                     240

              agent of a pharmaceutical. These protein complexes are particularly useful as drugs targets for the treatment or preventing of a disease or disorder. The complexes and methods above are useful in diagnosing or screening for the presence of a disease or disorder or a predisposition for developing a disease or disorder in a subject. These are also useful in screening for a drug for treatment or prevention of a disease or disorder. The molecule that modulates the amount, activity or protein components of the complex is useful for the manufacture of a medicament for the treatment or prevention of a disease or disorder. This sequence corresponds to a protein of the invention. (Note: the sequence data for this patent did not form part of the printed specification but was obtained from the EPO in electronic format).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 YERADWPREKLIDYFKNDTFALIGYGSQGYGQGLNLRDNGLNVIIGVRKDGASWKAAIED

                                                                                                                                strains useful for identification and validation of gene products as targets for therapeutic agents, for creating a collection of identified sessential genes, and screening assays for the discovery of new drugs. The invention provides the GRACE (gene replacement and conditional expression) method for the construction of mutant organisms referred to organism. The invention can be applied to any organism, particularly a pathogenic fungus e.g. Candida albicans, Aspergillus funigatus and Cryptococcus neoformans. The methods are useful to identify agents that may be used in the treatment of fungal infections. AAUIS053-AAUIS113 represent proteins encoded by C. albicans
                                                                                                                                                                                                                                                                                                                                                                                                       242

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent for treatment of a mammalian compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, contributery is signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and cell and essential Candida albicans protein used in the method of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treatment of crops, useful for controlling fungi on, e.g. cereals, potato, cotton or rape, comprises applying inhibitor of acetchydroxy acid isomeroreductase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fungi on, e.g. cereals, inhibitor of acetohydroxy acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             121 GWVPGKNLFTVEDAIKRGSYVMNLLSDAAQSETWPAIKPLLTKGKTLYFSHGFSPVFKDL 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a method of identifying a test compound as a candidate for an antibiotic comprising contacting ornithine carbamoytransfersae (OCTase) or ketol-acid reductoisemerase polypeptide, or fungal pathogenicity-conferring gene with a test compound. The method comprises: contacting OCTase polypeptide, ketol-acid reductoisemerase polypeptide, or fungal pathogenicity-conferring gene with a test compound; and detecting the presence or absence of binding between the test compound and the polypeptide or gene, where binding indicates that the test compound is a candidate for an antibiotic. Also described are: an isolated nucleic acid comprising a nucleotide sequence encoding a polypeptide having at least 50% sequence identity to, or having at least 10% of the activity of, 400, 403 or 469 amino acids; and an isolated

polypeptide consisting essentially of the amino acid sequence of 400, 4 or 469 amino acids. The methods are useful for identifying inhibitors cornithine carbamoytransferase, ketol-acid reductoisomerase, and fungal pathogenicity-conferring gene as antibiotics. This is the amino acid sequence of Magnaporthe grisea ketol-acid reductoisomerase ILVS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                125 GWVPGKNLFEVDEAISRGTVIMNLLSDAAQSETWPALKPQITKGKTLYFSHGFSPVFKDL

              The present invention relates to a method for controlling fungal disease in crops by applying an inhibitor (I) of acetohydroxyacid isomeroreductase. (I) are used for curative or preventative treatment of a wide range of fungal diseases on crops, e.g. cereals, potato, cotton or rape. The present sequence is an acetohydroxyacid isomeroreductase, used to illustrate the invention

The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a bofilm comprising A. fumigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid ariza, for examination or a paralog and arizay for examination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polymuclectides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypoptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              124

```
The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat a non-infectious by a pathogenic organism such as A. fumigatus, to treat a non-infectious by apthogenic organism such as A. fumigatus, to prevent or contain contamination of an object blofilm comprising A. fumigatus The polynucleotides are useful for expressing recombinant protein for characterisation, screening or comparising A. fumigatus of the polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for ralsing anti-protein antibodies, as an anti-DNA antibodies or to elicit another immune cresponse, and for identifying polynucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding circurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively cettering timenum electron which pathogenic organism invade or reside, and to be determine levels of the protein in biological fluids, as a marker for the factors. This sequence represents a protein of eace or virulence of accors. This sequence represents a protein of eace or virulence of accorselative receptors or ligands in the case or virulence.
                                                                                                                                                                                                        Fungicide, cytostatic, essential gene, Aspergillus fumigatus, infection, cancer, contamination, biofilm, antibody, immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Lemieux SM;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     71.8%; Score 1487.5; DB 6; Length 71.6%; Pred. The invention relates to novel purified or isolated nucleic acids of essential genes of Aspergillus fumigatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fumigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fumigatus, or to prevent or inhibit formation on a surface of a biofillm comprising A. fumigatus. The polynucleotides are useful for

```
therapeutic use, as markers for host tissues in which the pathogenic corganisms invested or reaide, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA comparing other related or distant pathogenic organisms to identify optential orthologous essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune cresponse, and for identifying polymucleotides encoding the other protein with binding occurs or to identify inhibitors of the binding of interaction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes constants.

WO200286090-A2

31-OCT-2002

The invention relates to nover purities or isolated nucleic acids of essential genes of Aspergillus fungatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic corganism such as A. funigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or inhibit formation on a surface of a blofilm comprising A. funigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or corganisms invede or reside, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA corganisms invede or reside, for distant pathogenic organisms of identify optermial orthologuus essential or virulence genes, for selecting and making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an engent or resides or identifying polynucleotides encoding the other protein antigen to raise anti-DNA antibodies or to elicit another immune corresponse, and for identifying polynucleotides encoding the other protein cinteraction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively conteraction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively conteraction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively conteraction. The polypeptides may be used to raise antibodies or to elicit immune response, as a reagent in assays designed to quantitatively contential manula protein of encorrelative receptors or ligands in the case or virulence or factors. This sequence represents a protein of one of the essential genes New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer. The invention relates to novel purified or isolated nucleic factors. This sequence represents a protes of Aspergillus fumigatus of the invention Disclosure; Page; 175pp; English.

Carbamoytransferase (OCTase) or ketol-acid reductoisomerase polypeptide,

or fungal pathogenicity-conferring gene with a test compound. The method

comprises: contacting OCTase polypeptide, ketol-acid reductoisomerase

polypeptide, or fungal pathogenicity-conferring gene with a test compound

; and detecting the presence or absence of binding between the test

compound and the polypeptide or gene, where binding between the test

test compound and the polypeptide or gene, where binding indicates that the

test compound at least 50% sequence encoding at least

10% of the activity of, 400, 403 or 469 amino acids; and an isolated

polypeptide consisting essentially of the amino acid sequence of 400, 403

or 469 amino acids. The methods are useful for identifying inhibitors of

ornithine carbamoytransferase, ketol-acid reductoisomerase, and fungal

pathogenicity-conferring gene as antibiotics. This is the amino acid

sequence of Mycosphaerella graminicola ketol-acid reductoisomerase KARI.

A polymuclectide of the invention has fungicide activity, and may have use in gene therapy. The nucleic acid is useful for preparing a use in gene treating an infection caused by Cryptococcus neoformans. The present sequence represents a C. neoformans sequence of the invention. Note: The sequence data for this patent is not represented in

the invention fractate to an interest and understanding any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense conding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation or the activity of agene in an operon required for the gene product or that has an activity against a biological pathway required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene or which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the collection of an organism. The antisense nucleic acids are useful for for collectional description of an organism. The antisense nucleic acids are quired for collectional descriptions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1;
